## Framing my presentation

FAIR is intended to help machines help people!

Replace time spent in data discovery/manipulation with time spent on thoughtful investigation of global data and knowledge

IT WORKS! We can now prove it!

We have also experienced some notable failures...

## Start with the Problems: Measuring FAIRness

Am I FAIR?

How can I know?

Now with ~15,000 citations

[More detail >>](#)

Comment | [OPEN](#)

# The FAIR Guiding Principles for scientific data management and stewardship

Mark D. Wilkinson, Michel Dumontier, IJsbrand Jan Aalbersberg, Gabrielle Appleton, Myles Axton, Arie Baak, Niklas Blomberg, Jan-Willem Boiten, Luiz Bonino da Silva Santos, Philip E. Bourne, Jildau Bouwman, Anthony J. Brookes, Tim Clark, Mercè Crosas, Ingrid Dillo, Olivier Dumon, Scott Edmunds, Chris T. Evelo, Richard Finkers, Alejandra Gonzalez-Beltran, Alasdair J.G. Gray, Paul Groth, Carole Goble, Jeffrey S. Grethe, Jaap Heringa, Peter A.C. 't Hoen, Rob Hooft, Tobias Kuhn, Ruben Kok, Joost Kok, Scott J. Lusher, Maryann E. Martone, Albert Mons, Abel L. Packer, Bengt Persson, Philippe Rocca-Serra, Marco Roos, Rene van Schaik, Susanna-Assunta Sansone, Erik Schultes, Thierry Sengstag, Ted Slater, George Strawn, Morris A. Swertz, Mark Thompson, Johan van der Lei, Erik van Mulligen, Jan Velterop, Andra Waagmeester, Peter Wittenburg, Katherine Wolstencroft, Jun Zhao & Barend Mons  - [Show fewer authors](#)

## The FAIR Guiding Principles...

*“This necessitates machines to be capable of autonomously and appropriately acting when faced with the wide range of types, formats, and access-mechanisms/protocols that will be encountered during their self-guided exploration of the global data ecosystem.”*

<https://www.nature.com/articles/sdata201618>

When I wrote this paragraph, I was imagining a Web of data discovery and exploration agents

*“This necessitates machines to be capable of autonomously and appropriately acting when faced with the wide range of types, formats, and access-mechanisms/protocols that will be encountered during their self-guided exploration of the global data ecosystem.”*

<https://www.nature.com/articles/sdata201618>

## Notable consequence #1

FAIR is, first, a mechanism to guide **automated agents** to discovery of task-relevant data

As a consequence, FAIR is, before all else, about **metadata**.

*“This necessitates machines to be capable of autonomously and appropriately acting when faced with the wide range of types, formats, and access-mechanisms/protocols that will be encountered during their self-guided exploration of the global data ecosystem.”*

<https://www.nature.com/articles/sdata201618>

## Notable consequence #2

Creating a Web of data that can be *appropriately* (re)used by machines necessitates specific data publishing behaviors

These behaviors can be (must be!) concretely described

Software agents then leverage these behaviors to find, access, and appropriately reuse the correct data

## Notable consequence #3

This means that FAIRness must also be

*measurable*

by similar automated agents

(i.e. are you providing sufficient metadata, and providing it in a manner that can be automatically discovered and interpreted to direct an agent to what it needs?)

## The FAIR Evaluator

The first fully-automated “agent” for testing FAIRness of a resource

Resulted from early pressure (2017) from e.g. journal editors who wanted to require FAIRness

# Acknowledgement of Susanna-Assunta Sansone

Several of the following slides are adaptations of slides she created for a presentation we jointly gave a few weeks ago

## Susanna-Assunta Sansone

University of Oxford, UK

- ELIXIR Interoperability Platform Co-Lead
- Author of the FAIR Principles, and contributors to a couple of FAIRness assessment tools
- PI of FAIRsharing, and co-lead of FAIR Cookbook, among other FAIR-supporting resources

# Motivation for FAIR testing

Fairness does not mean everyone gets the same. Fairness means everyone gets what they need.

Rick Riordan

quoteancy

- FAIR is a set of principles, not a standard
- The narrative is **insufficient** to circumscribe the valid mechanisms to achieve the behaviours they describe

Nevertheless, we need to trust claims such as

*“I am FAIR”, or “My data is FAIR”, or “My repository enables FAIR”*

FAIR

<http://w3id.org/AmIFAIR>

The screenshot shows the homepage of the FAIR Evaluation Services website. At the top, there is a navigation bar with the title 'FAIR Evaluation Services' and menu items: HOME, EVALUATIONS, METRICS, and COLLECTIONS. A search bar on the right contains the text 'Search tests and collection' and a 'SEARCH' button. Below the navigation bar is a large blue gradient banner with the text 'FAIR Evaluation Services' and 'Resources and guidelines to assess the FAIRness of digital resources.' Underneath the banner, there are social media icons for Fork, Star (46), and Watch (22). The main content area features three service cards: 'Import Maturity Indicators' (with a gear icon), 'Create collections' (with a list icon), and 'Evaluate resources' (with a scales icon). Each card includes a brief description and a 'Get started' button.

Any stakeholder provides the URL of any Digital Object, and ~22 distinct tests of “FAIRness” are executed on that Object

# The FAIR Evaluator Harvester

At its core, The Evaluator consists of a “very forgiving” metadata harvesting workflow & library

# The FAIR Evaluator Tests (example)

**FAIR Principle F3:** metadata explicitly include the identifier of the data it describes

Test Workflow:

Explore the harvested metadata for any metadata facet that *appears to be* a reference to a data record

(there are 18 possibilities that are acceptable)

# Evaluator usage

~10,000 FAIRness evaluations run using the public version

Several thousand evaluations run using the private version from my company

Executions of individual tests are not monitored, but do occur frequently

# FAIRness is not a competition! ...or is it?

Resource	Execution Type
5 Star Data Rating Tool	Manual - questionnaire
Data Stewardship Wizard	Predictive: based on a manually filled questionnaire
F-UJI	Automated
FAIR Data Self-Assessment Tool	Manual - questionnaire
FAIR Evaluator	Automated
FAIR enough?	Manual - checklist
FAIR-Aware (BETA)	Manual - questionnaire
FAIR-Checker	Automated
FAIRdat	Manual - questionnaire
FAIRness self-assessment grids	Manual - checklist
FAIRshake	Manual - questionnaire, Semi-manual
GARDIAN FAIR Metrics	Manual - checklist
RDA Maturity Model	Manual - checklist

As of Aug 2024, there are  
**28 independent evaluation, assessment, assistance tools**

(see list at <https://fairassist.org>)

**The tests used and the results given are inconsistent, and not comparable**

The  
**FAIR**  
Shop

- Mostly questionnaires, few are (semi)automated
- Mostly focused on **metadata**
- They use distinct, often subjective ways of measuring FAIRness
- We lack a set of common, trusted FAIR metrics, and their reproducible FAIR tests

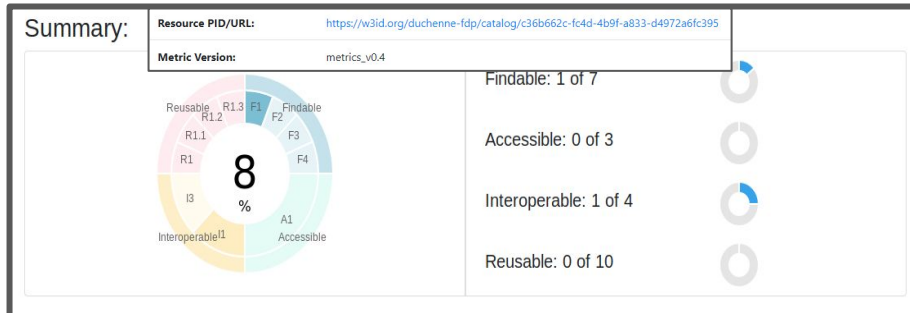

# How different can they be?

Comparison of The Evaluator\*\* with F-UJI, on the same Digital Object  
 (a Catalog record in the Duchenne Parent Project Patient Registry)

**20/22 Tests Pass**

**2/24 Tests Pass**

What is “metadata”?

What is “metadata”?

When should links be followed to search for metadata, and which ones?

What is “metadata”?

When should links be followed to search for metadata, and which ones?

To what extent must a standard be followed?

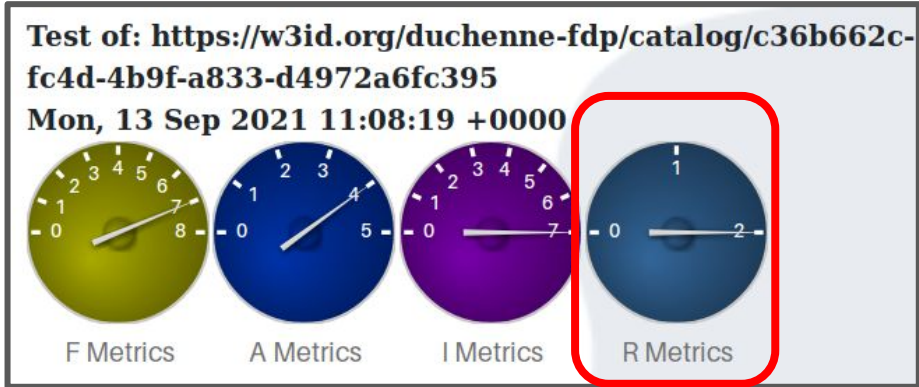

What is “metadata”?

When should links be followed to search for metadata, and which ones?

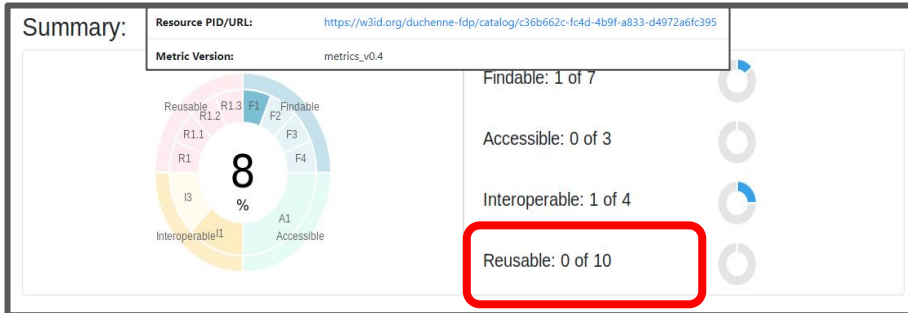

To what extent must a standard be followed?

Is it acceptable to mix-n-match standards, rather than using one that covers everything?

Not even agreement on what the Principles *mean!*

# EOSC FAIR Metrics TF “Apples to Apples” workshops & hackathons (2022-2023) Summary

Addressing the problem collaboratively, with key stakeholders:

- Creators of all automated FAIR assessment tools came together over 6 sessions
- Included several generalist repository representatives (e.g. Dataverse, Zenodo)
- Discussed the bases for the differences in FAIR assessment
- Identified that **metadata discovery and harvesting** was approached differently
  - Different expectations, and different levels of “tolerance” between tools
    - what is considered an “error” versus an “acceptable bit of weirdness”
  - This results in different “substrates” that are then submitted to the test

# EOSC FAIR Metrics TF “Apples to Apples” workshops & hackathons (2022-2023) Summary

Addressing the problem collaboratively, with key stakeholders:

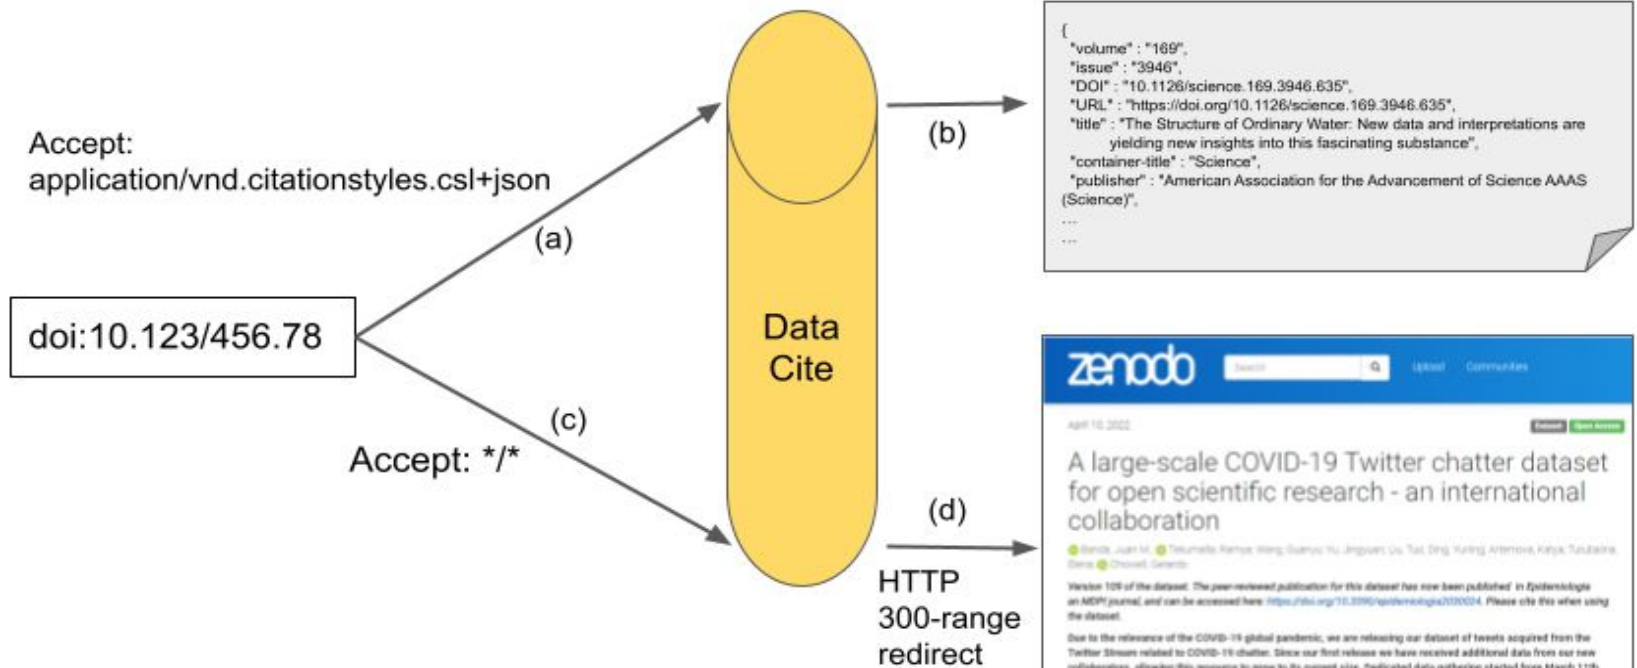

- Creators of all automated FAIR assessment tools came together over 6 sessions
- Included several generalist repository representatives (e.g. Dataverse, Zenodo)
- Discussed the bases for the differences in FAIR assessment
- Identified that **metadata discovery and harvesting** was approached differently
  - Different expectations, and different levels of “tolerance” between tools
    - what is considered an “error” versus an “acceptable bit of weirdness”
  - This results in different “substrates” that are then submitted to the test

How metadata harvesting becomes a source of  
discord between the FAIR assessment systems

# DOI resolution to metadata

Eventually leads to a “landing page”

zenodo

April 10, 2022

A large-scale COVID-19 Twitter chatter dataset for open scientific research - an international collaboration

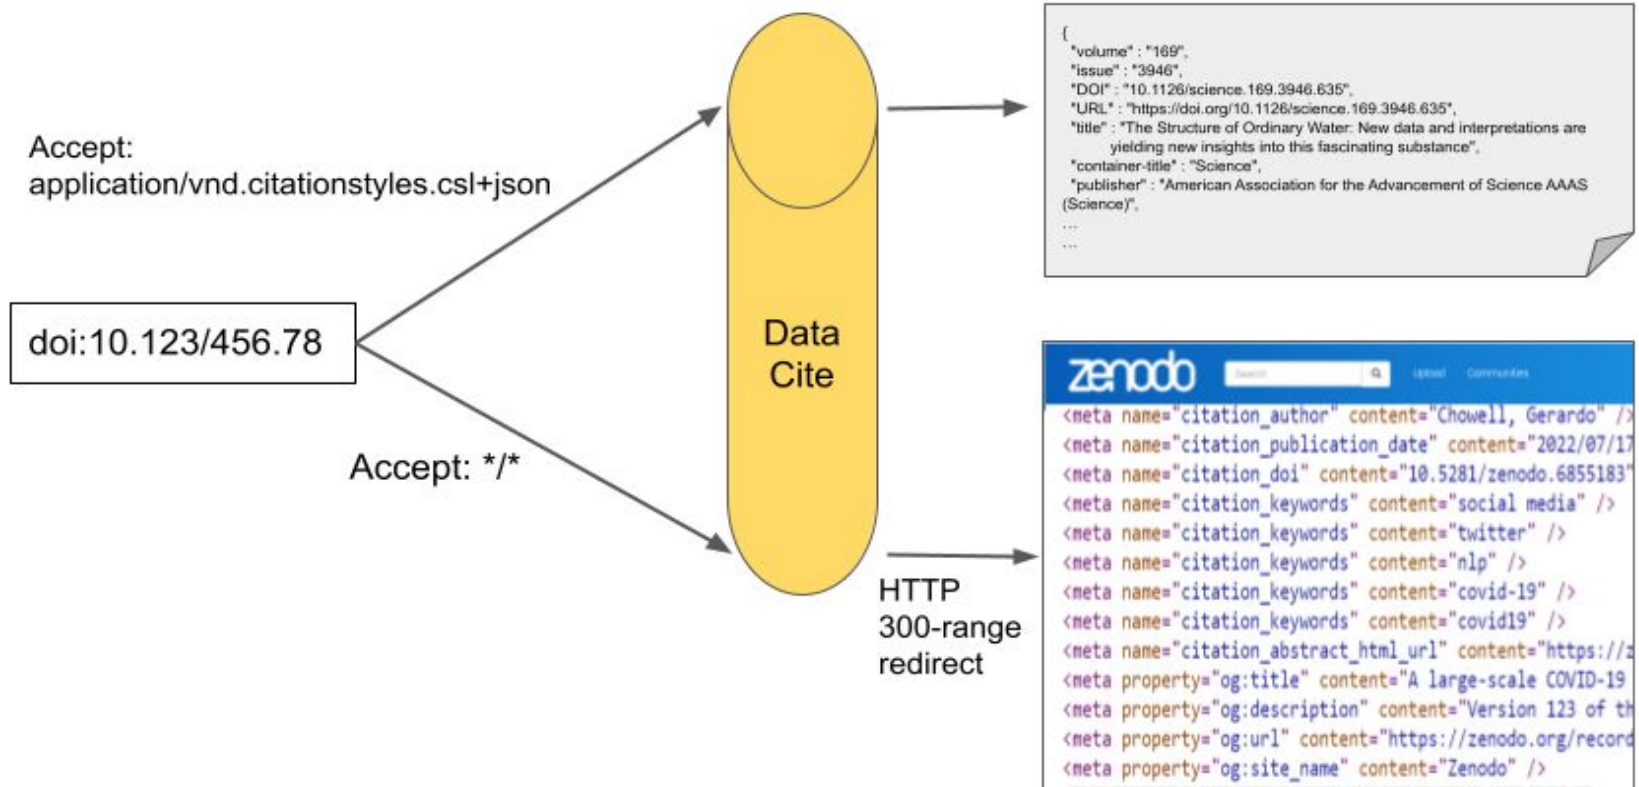

Version 109 of the dataset. The peer-reviewed publication for this dataset has now been published in *Epidemiology and Infection* journal, and can be accessed here <https://doi.org/10.1017/S0950268821000024>. Please cite this when using the dataset.

Due to the relevance of the COVID-19 global pandemic, we are releasing our dataset of tweets acquired from the Twitter Stream related to COVID-19 chatter. Since our first release we have received additional data from our new collaborators, allowing this resource to grow to its current size. Dedicated data gathering started from March 11th yielding over 4 million tweets a day. We have added additional data provided by our new collaborators from January 27th to March 27th, to provide extra longitudinal coverage. Version 10 added ~1.5 million tweets in the Russian language collected between January 1st and May 8th, graciously provided to us by Katya Artemova (MSU HSE) and Elena Tsubolina (RTU). From version 12 we have included daily hashtags, mentions and emojis and their frequencies in the respective zip files. From version 14 we have included the tweet identifiers and their respective language for the clean version of the dataset. Since version 20 we have included language and place location for all tweets.

The data collected from the stream captures all languages, but the higher prevalence are: English, Spanish, and French. We release all tweets and retweets on the full\_dataset for file (1,329,134,697 unique tweets), and a cleaned version with no retweets on the full\_dataset-clean file (343,273,315 unique tweets). There are several practical reasons for us to leave the retweets, tracking important tweets and their dissemination is one of them. For NLP tasks we provide the top 1000 frequent terms in frequent\_terms.csv, the top 1000 bigrams in frequent\_bigrams.csv, and the top 1000 trigrams in frequent\_trigrams.csv. Some general statistics per day are included for both datasets in the

# DOI resolution to metadata

```

“If the **alternate** keyword is used with the **type** attribute, it indicates that the referenced document is a reformulation of the current document in the specified format.”

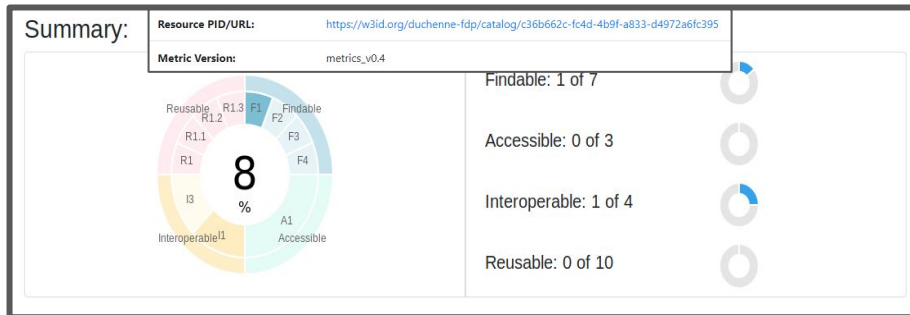

# Many sources of ambiguity

- A metadata harvesting agent has to guess (or be coded to know) what to do with a GUID
- There is partial overlap between the DataCite-sourced metadata and Repository metadata
- The use of typed links is a source of ambiguity due to **different interpretations of the spec**
- The interpretation of a “landing page” itself is ambiguous (“**the current document**”?)
  - Some DOIs resolve directly to data, this one resolves to a landing page
  - **What, then, does the DOI represent? The landing page, or the data?**
  - **What is the interpretation of landing-page embedded metadata?**
- **There is no consistent way to discover the data\*\*\***
- **There is no consistent way to discover provider-sourced metadata\*\*\***
  - **the most important stuff, IMO!!**
- **This is one example, with a widely accepted identifier system and a mature repository**
  - In the “Wild Web” - the “long-tail” of data publishing - unexpected things happen
  - Testing needs to be applied to all kinds of publishers, with widely different expertise

# And that's how you end up with this!

20/22 Tests Pass

2/24 Tests Pass

## How do you resolve fundamental disagreement among experts?

Hint: Ignore it!

# The choice of Signposting for achieving FAIR

With 28 Assessment frameworks there seemed to be too much disagreement

(also no incentive to harmonize!)

The solution, therefore, was to “move the goalposts”!

Rather than trying to harmonize the FAIR Assessment tools, pick a FAIR publishing solution that tool owners agreed is completely FAIR

Make sure our assessment tools all score that solution in exactly the same way

# FAIR Signposting “Level 1”\*

<b>Table 1: Link Relations used by FAIR Signposting</b>	
<b><u>Relation</u></b>	<b><u>Usage</u></b>
cite-as	A one-to-one relationship between the entity and its globally unique identifier
describedby	A one-to-many relationship between the entity and all known metadata records about that entity
item	A one-to-many relationship between an entity representing a deposit and the data file(s) it contains.

These links can appear in:

- The body of the HTML (“Typed Links”)
- The Headers of the HTTP message (“Link Headers”)

Therefore can be used on both Web pages, as well as other non-HTML digital objects

\* a subset of “Signposting”, **Van de Sompel & Nelson, 2015: <http://doi.org/10.1045/november2015-vandesompel>**

# FAIR Signposting harvesting workflow

**HYPOTHETICAL**

I'm showing what we imagine **could** be done

Some behaviours are already being implemented

Others will no doubt require more extensive changes

Nevertheless, I think there is some “low hanging fruit” that gives us some critical early wins, particularly w.r.t. FAIR agents and assessment tooling

# FAIR Signposting harvesting workflow

Starting Point:

Web Search  
Bookmark  
DOI resolution  
Other ID resolution  
...

The screenshot shows the Zenodo interface for a dataset. At the top, there is a blue header with the Zenodo logo, a search bar, and links for 'Upload' and 'Communities'. Below the header, the date 'April 10, 2022' is displayed on the left, and 'Follow' and 'Open Access' buttons are on the right. The main title of the record is 'A large-scale COVID-19 Twitter chatter dataset for open scientific research - an international collaboration'. Below the title, the authors are listed: Banda, Juan M., Tekumalla, Ramya, Wang, Guanyu, Yu, Jingyuan, Liu, Tuo, Ding, Yuning, Artemova, Katya, Tutubalina, Elena, Chowell, Gerardo. A note indicates that version 109 of the dataset has been published in the journal *Epidemiologia* and provides a DOI link: <https://doi.org/10.3390/epidemiologia2030024>. The main body of the record contains a detailed description of the dataset, its history, and the data files provided. It mentions that the dataset is released due to the relevance of the COVID-19 pandemic and that it has grown since its first release. It also notes that the data is cleaned and that the dataset includes tweets in multiple languages (English, Spanish, French, Russian) and includes various metadata like hashtags, mentions, and emojis.

- 07-http-describedby-citeas-linkset-json/
- 08-http-describedby-citeas-linkset-txt/
- 09-http-describedby-citeas-linkset-json-txt/
- 10-http-citeas-not-perma/
- 11-http-describedby-iri-wrong-type/
- 12-http-item-does-not-resolve/
- 13-http-describedby-with-type/
- 14-http-describedby-citeas-linkset-json-txt-conneg/
- 15-http-describedby-no-conneg/
- 16-http-describedby-conneg/
- 17-http-citeas-multiple-rels/
- 18-html-citeas-only/

- We have 78+ Benchmarks
  - positive examples and negative examples
- Challenge metadata harvesting workflows
  - to ensure that they are all working in exactly the same way
- First step in harmonization of FAIR assessments
  - this is leading towards a **governance mechanism** for FAIR assessment

# Work in progress but uptake of signposting has begun!

A collaboration between:

<https://datascience.nih.gov/data-ecosystem/generalist-repository-ecosystem-initiative>

Note that this is being considered as the metadata infrastructure for the European Health Data Space

# Returning to this list of ambiguities

- A metadata harvesting agent has to guess (or be coded to know) what to do with a GUID
- There is partial overlap between the DataCite-sourced metadata and Repository metadata
- The use of typed links is a source of ambiguity due to different interpretations of the spec
- The interpretation of the “landing page” itself is ambiguous
  - Some DOIs resolve directly to data, this one resolves to a landing page
  - What, then, does the DOI represent? The landing page, or the data?
  - What is the interpretation of landing-page embedded metadata?
- **There is no consistent way to discover the data\*\*\***
- **There is no consistent way to discover provider-sourced metadata\*\*\***
  - **the most important stuff, IMO!!**
- This is one example, with a widely accepted identifier system and a mature repository
  - In the “Wild Web” - the “long-tail” of data publishing - unexpected things happen
  - Testing needs to be applied to all kinds of publishers, with widely different expertise

# Returning to this list of ambiguities

## What are the FAIR evaluation tools actually testing??

- A metadata harvesting agent has to guess (or be coded to know) what to do with a GUID
- There is partial overlap between the DataCite-sourced metadata and Repository metadata
- The use of typed links is a source of ambiguity due to different interpretations of the spec
- The interpretation of the “landing page” itself is ambiguous
  - Some DOIs resolve directly to data, this one resolves to a landing page
  - What, then, does the DOI represent? The landing page, or the data?
  - What is the interpretation of landing-page embedded metadata?
- **There is no consistent way to discover the data\*\*\***
- **There is no consistent way to discover provider-sourced metadata\*\*\***
  - **the most important stuff, IMO!!**
- This is one example, with a widely accepted identifier system and a mature repository
  - In the “Wild Web” - the “long-tail” of data publishing - unexpected things happen
  - Testing needs to be applied to all kinds of publishers, with widely different expertise

# Returning to this list of ambiguities

In most cases, they are testing the repository!

- A metadata harvesting agent has to guess (or be coded to know) what to do with a GUID
- There is partial overlap between the DataCite-sourced metadata and Repository metadata
- The use of typed links is a source of ambiguity due to different interpretations of the spec
- The interpretation of the “landing page” itself is ambiguous
  - Some DOIs resolve directly to data, this one resolves to a landing page
  - What, then, does the DOI represent? The landing page, or the data?
  - What is the interpretation of landing-page embedded metadata?
- **There is no consistent way to discover the data\*\*\***
- **There is no consistent way to discover provider-sourced metadata\*\*\***
  - **the most important stuff, IMO!!**
- This is one example, with a widely accepted identifier system and a mature repository
  - In the “Wild Web” - the “long-tail” of data publishing - unexpected things happen
  - Testing needs to be applied to all kinds of publishers, with widely different expertise

## Is FAIR fulfilling its objectives?

Are we yet supporting the discovery and appropriate reuse of **data**?

What incentive do data providers have to make their data FAIR if there's no access to it?

# EOSC Task Force Phase 2

## PHASE 1 (2021-2023)

**FAIR Metrics and Data Quality TF:**  
<https://eosc.eu/advisory-groups/fair-metrics-and-data-quality>

Outputs formally approved by EOSC

DOI [10.5281/zenodo.10797765](https://doi.org/10.5281/zenodo.10797765)

Report on FAIR Evaluation community survey

March 8, 2024

DOI [10.5281/zenodo.10490289](https://doi.org/10.5281/zenodo.10490289)

Report on FAIR Signposting and its Uptake by the Community

January 11, 2024

DOI [10.5281/zenodo.7515816](https://doi.org/10.5281/zenodo.7515816)

TOWARDS A DATA QUALITY FRAMEWORK FOR EOSC

January 9, 2023

DOI [10.5281/zenodo.7463421](https://doi.org/10.5281/zenodo.7463421)

FAIR Assessment Tools: Towards an "Apples to Apples" Comparisons

December 20, 2022

DOI [10.5281/zenodo.7390482](https://doi.org/10.5281/zenodo.7390482)

Community-driven Governance of FAIRness Assessment: An Open Issue, an Open Discussion

December 1, 2022

## PHASE 2 (2024-2025)

**FAIR Metrics and Digital Objects TF:**  
<https://eosc.eu/advisory-groups/fair-metrics-and-digital-objects-task-force>

Goals as set by EOSC

- Identify the *limitations* of the current FAIR assessment v.v. testing repositories vs. data
- Identify issues on *data privacy*, considering data usage (machine-actionable data usage policies) and *licensing*
- Examine how provenance is being handled in federated environments

## PHASE 2 (2024-2025)

### FAIR Metrics and Digital Objects TF:

<https://eosc.eu/advisory-groups/fair-metrics-and-digital-objects-task-force>

To what degree is FAIRness making a difference at all, v.v. the **reuse of data**?

Is there hope on the horizon?

# Can we prevent the situation from getting worse?

Resource	Execution Type
5 Star Data Rating Tool	Manual - questionnaire
Data Stewardship Wizard	Predictive: based on a manually filled questionnaire
F-UJI	Automated
FAIR Data Self-Assessment Tool	Manual - questionnaire
FAIR Evaluator	Automated
FAIR enough?	Manual - checklist
FAIR-Aware (BETA)	Manual - questionnaire
FAIR-Checker	Automated
FAIRdat	Manual - questionnaire
FAIRness self-assessment grids	Manual - checklist
FAIRshake	Manual - questionnaire, Semi-manual
GARDIAN FAIR Metrics	Manual - checklist
RDA Maturity Model	Manual - checklist

As of Aug 2024, there are **28 independent tools** (evaluation, assessment, assistance tools, see list at <https://fairassist.org>)

**The tests used and the results given are inconsistent, and not comparable**

The  
**FAIR**  
Shop

- Mostly questionnaires, few are (semi)automated
- They use distinct, often subjective ways of measuring FAIRness
- We lack a set of common, trusted FAIR metrics, and their reproducible FAIR tests

➔ Along with a **common set of metrics/tests**, we also need a **governance** model to review and adopt new ones, to ensure quality, relevance, value and trust

# ostrails

Delivering the Commons to Plan-Track-Assess research in EOSC

University of Oxford, UK

FAIR Metrics  
Governance co-lead

## FAIR Metrics and Assessment Workpackage:

- Operationalize the decisions of the EOSC Task Forces
- Harmonize FAIR Assessment environment through standards and APIs
- Design and publish metrics and tests for a range of digital objects beyond “data”, as well as domain-specific assessments
- Provide clarity around the terminology of assessment
- Professionalize the FAIR assessment ecosystem through **good governance**

# Harmonize through standards and APIs

## FAIR Test Results vocabulary

# Benchmark Signposting Test Suite for the FAIR Champion\* FAIR Assessment Tool

Governance and Professionalism:  
ensure that all FAIR tests comply with the standards

\*FAIR Champion is the evolution of the FAIR Evaluator, that will be compliant with the OStrails APIs and standards

**Things will get better soon!**

## End with Success Stories: FAIR works!\*

Two examples:

Rare Diseases

Seed Banking

\* with some important caveats

# An example of a successful large-scale FAIRification initiative

The European Joint Programme on Rare Diseases  
(EJP-RD)

**+1800**  
people

**35 participating**  
countries

26 EU MS, 7 associated (AM, CH, GE, IL, NO, RS, TK), UK and CA

**ALL 24 ERNs**

**101 M€**  
Budget

Union contribution: 55 M€ (70% reimbursement rate)

# EJP RD in numbers

**91 beneficiaries**

- 10 hospitals
- 12 research institutes
- 31 research funding bodies/ ministries
- 27 universities/hospital universities
- 5 EU infrastructures
- 5 charities/foundations
- EURORDIS

**+ 52 linked third parties**

**+100% associated networks**

**+1800**  
people

# EJP RD in numbers

**91** beneficiaries  
 10 hospitals  
 12 research institutes

**35** participating countries

26 EU MS, 7 associated (Algeria, Argentina, Brazil, Canada, Chile, India, Israel, Japan, Korea, Mexico, Norway, Poland, Portugal, Romania, Saudi Arabia, South Africa, South Korea, Switzerland, Taiwan, Thailand, Turkey, United States)

**ALL 24** EU member states

**101** million  
Budget

Union contribution: 55 M€ (70% reimbursement rate)

## Challenge: Make it all FAIR

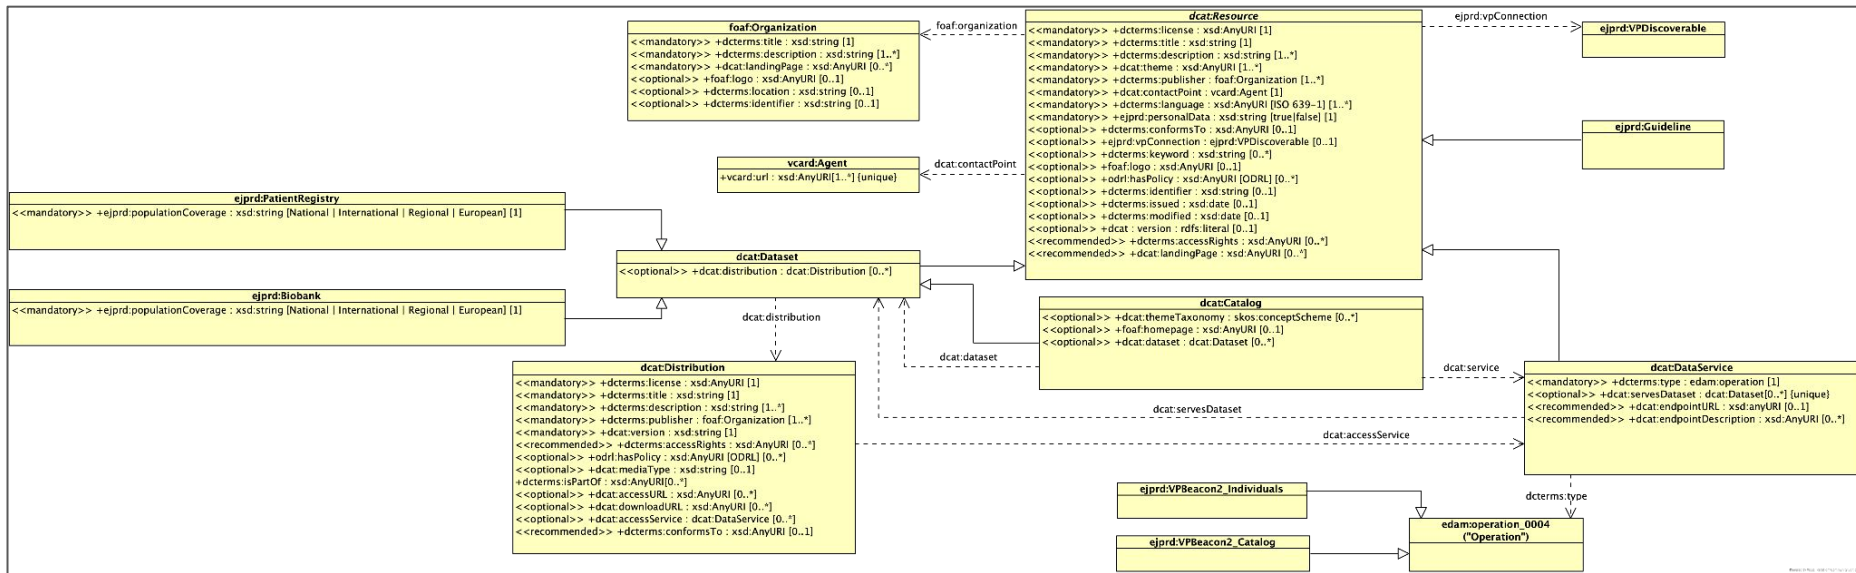

...but how?

funding bodies/ ministries  
 hospital universities  
 research centres  
 foundations  
 third parties  
 associated networks

# Step 1 - Focus on Metadata that answers the question: "What kind of data does this partner have"?

## EJP-RD Metadata Schema:

- Based on DCAT; attempts to follow the European DCAT-AP
- Published by all sites via semi-automated process using Excel spreadsheets

# EJP-RD Metadata Publication Platform: FDP

- Open-source, currently distributed via Docker images
- Installs in seconds
- Publishes **DCAT metadata** for human exploration
- Publishes **DCAT metadata** for agent-based exploration
- Provides easy-to-use DCAT editing tools via Web pages
- Automatically registers the new FDP in a central index

**Step 1 - Focus on Metadata**

# Result: a federated network of FDPs representing all biobanks and patient registries

**Step 1 - Focus on Metadata**

# FAIR ~~Data~~

Metadata Metadata Metadata!

Am I suggesting that there's no point in making FAIR data?

No...

but there's little point in working on FAIR data until you get  
the discovery metadata right!

Some data will never be made FAIR!

# FAIR Data

However...

EJP-RD also created FAIR Data

via an end-user-friendly reusable  
FAIRification pipeline

This led to some amazing examples of  
data-level interoperability!

# Challenge

Need to make all data-focused network partner's (~50) resources work together

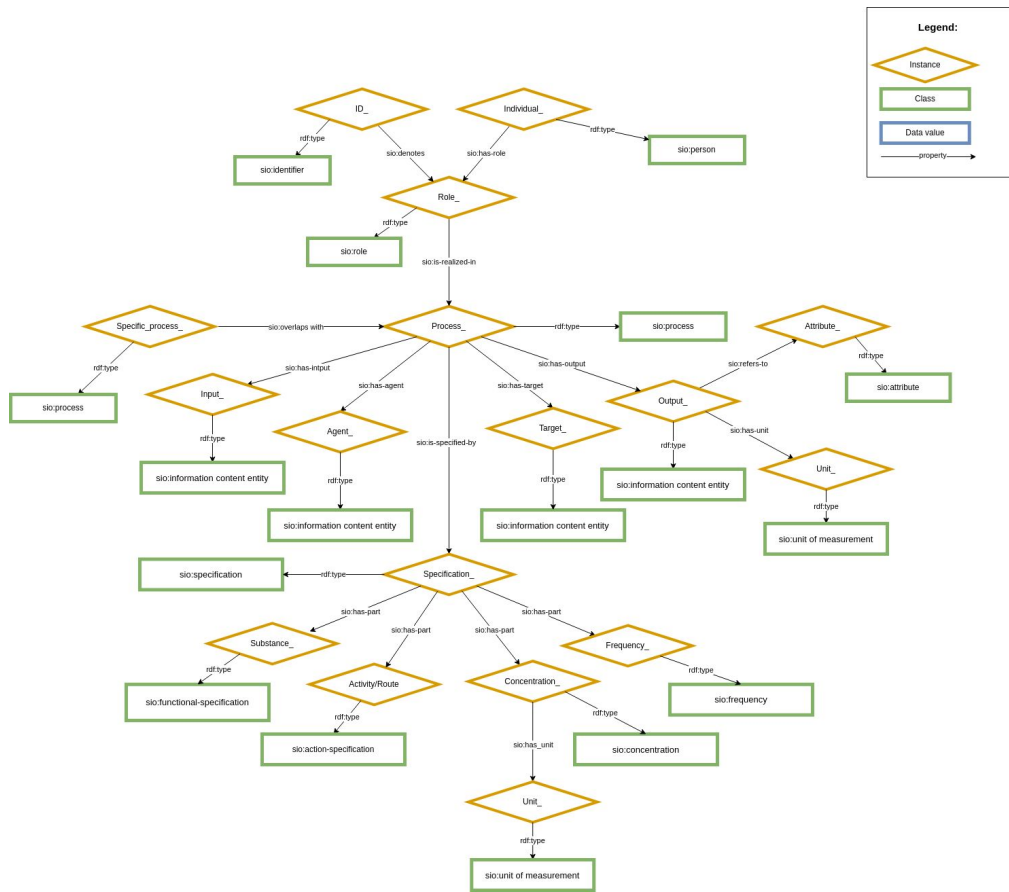

Partners have similar data (patient registry or biobank samples)

Partners have different starting formats

**Generally, they are forbidden from sharing or moving their data**

So the participants are going to have to do the FAIR transformation themselves, on-site, sometimes without even letting the FAIR experts see it!

# Step 2: Build a shared, generic FAIR data model

Dr. Michel Dumontier,  
UMaastricht,  
SemanticScience  
Integrated Ontology

Pablo Alarcón,  
Clinical and Registry  
Entries Semantic  
Model (CARE-SM)

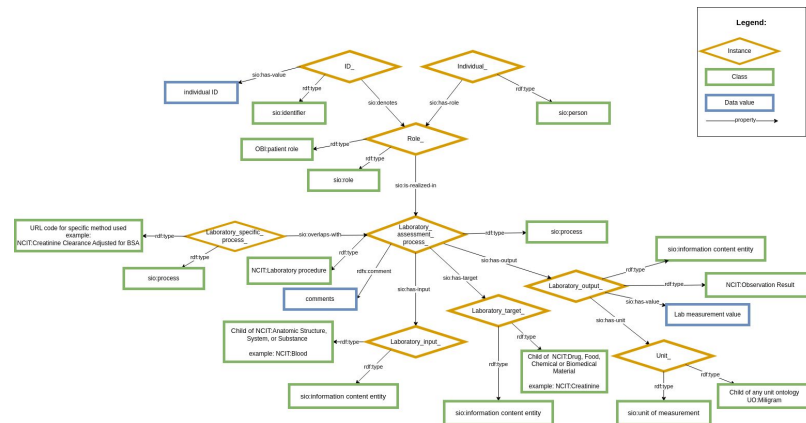

# Step 3: Use CSV as a “lingua franca” for all partners

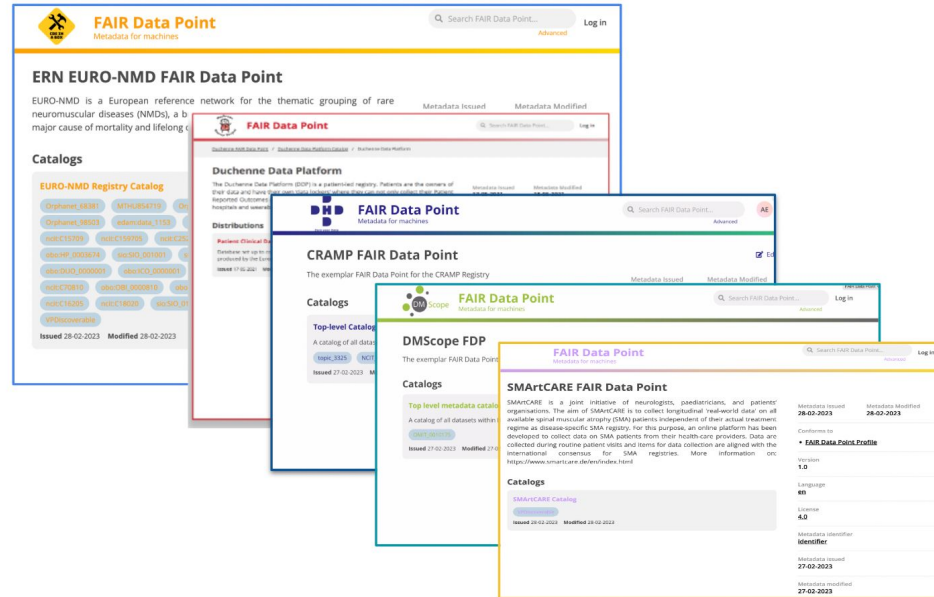

## CSV Generated by the participants (easy!)

Property	Observation	Value	Date
Diagnosis	ORPHA:98896	-	2021-02-01
Body Measurement	NCIT_C25208	28kg	2020-04-05
Laboratory Measurement	NCIT_C399	10mg/L	2020-04-05

Fully automated transformation and “publication” of FAIR data into their FAIR Data Point

# Does this work, in practice?

The image shows five overlapping screenshots of the FAIR Data Point interface, each representing a different NMD registry:

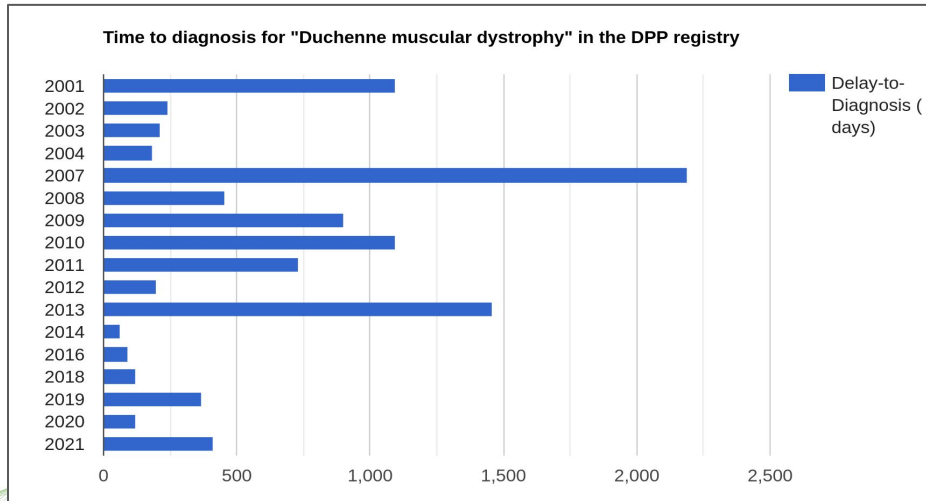

- ER N EURO-NMD FAIR Data Point:** Metadata for machines. Description: "ER N EURO-NMD is a European reference network for the thematic grouping of rare neuromuscular diseases (NMDs), a b major cause of mortality and lifelong c".
- Duchenne Data Platform:** Metadata for machines. Description: "The Duchenne Data Platform (DDP) is a patient-led registry. Patients are the owners of their data and have the right to control their data. The DDP is a patient-led registry for Duchenne and related".
- CRAMP FAIR Data Point:** Metadata for machines. Description: "The exemplar FAIR Data Point for the CRAMP Registry".
- DMScope FDP:** Metadata for machines. Description: "The exemplar FAIR Data Point".
- SMARTCARE FAIR Data Point:** Metadata for machines. Description: "SMARTCARE is a joint initiative of neurologists, paediatricians, and patient organisations. The aim of SMARTCARE is to collect longitudinal real-world data on all available spinal muscular atrophy (SMA) patients independent of their actual treatment regime in disease-specific SMA registries. For this purpose, an online platform has been developed to collect data on SMA patients from their health care providers. Data are collected during routine patient visits and data for data collection are aligned with the international consensus for SMA registries. More information on: <https://www.smartcare.de/en/index.html>".

## Five FAIR Data Points for partners representing NMDs

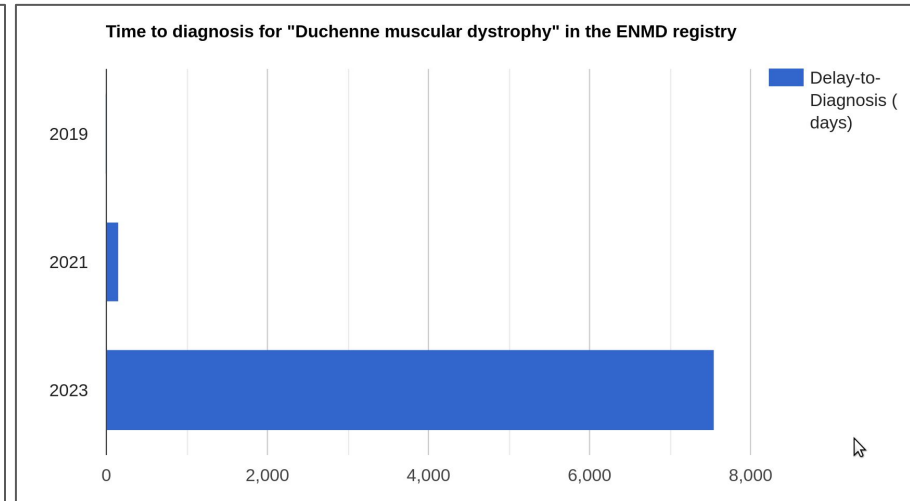

# “What is the delay between symptom onset and diagnosis?”

- 1) The same query\* sent to all participants (shared model)
- 2) Integrate the output

### Duchenne Parent Project (DPP)

### EURO-NMD (mock data)

# ***Caveat emptor!!***

FAIR alone is NOT sufficient to  
achieve interoperability!

# This paper compares two independent FAIRification efforts (C-PATH and CARE-SM) over identical data items

Journal of the Society for  
Clinical Data Management

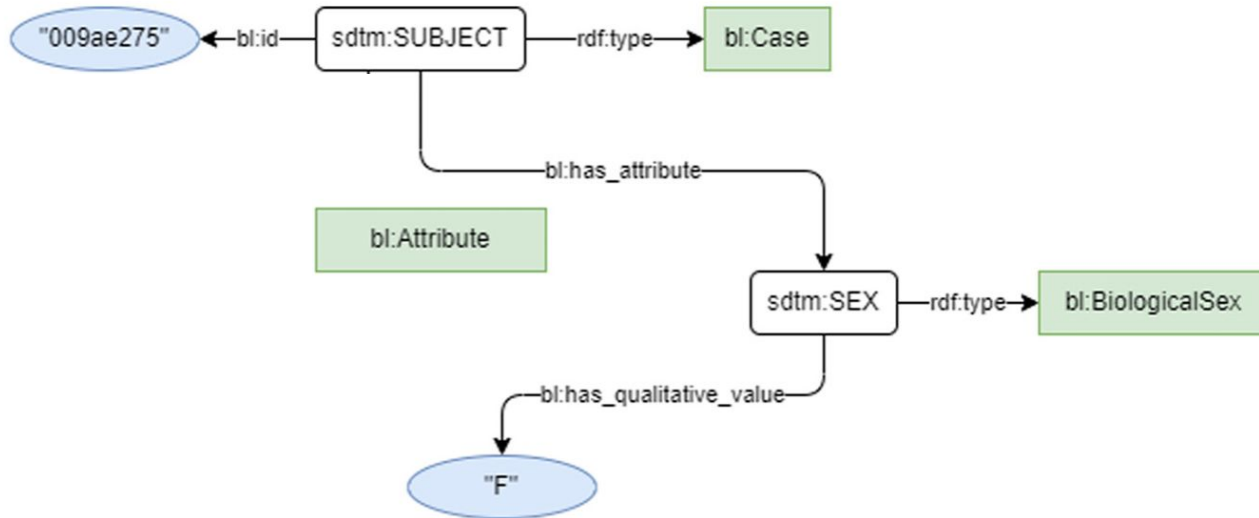

Alarcón-Moreno P, et al. Leveraging Biolink as a FAIR “Rosetta Stone”  
Between Clinical Semantic Models Provides Emergent Interoperability.  
*Journal of the Society for Clinical Data Management*. 2022; 2(3): 2,  
pp.1-8. DOI: <https://doi.org/10.47912/jscdm.130>

## ORIGINAL RESEARCH

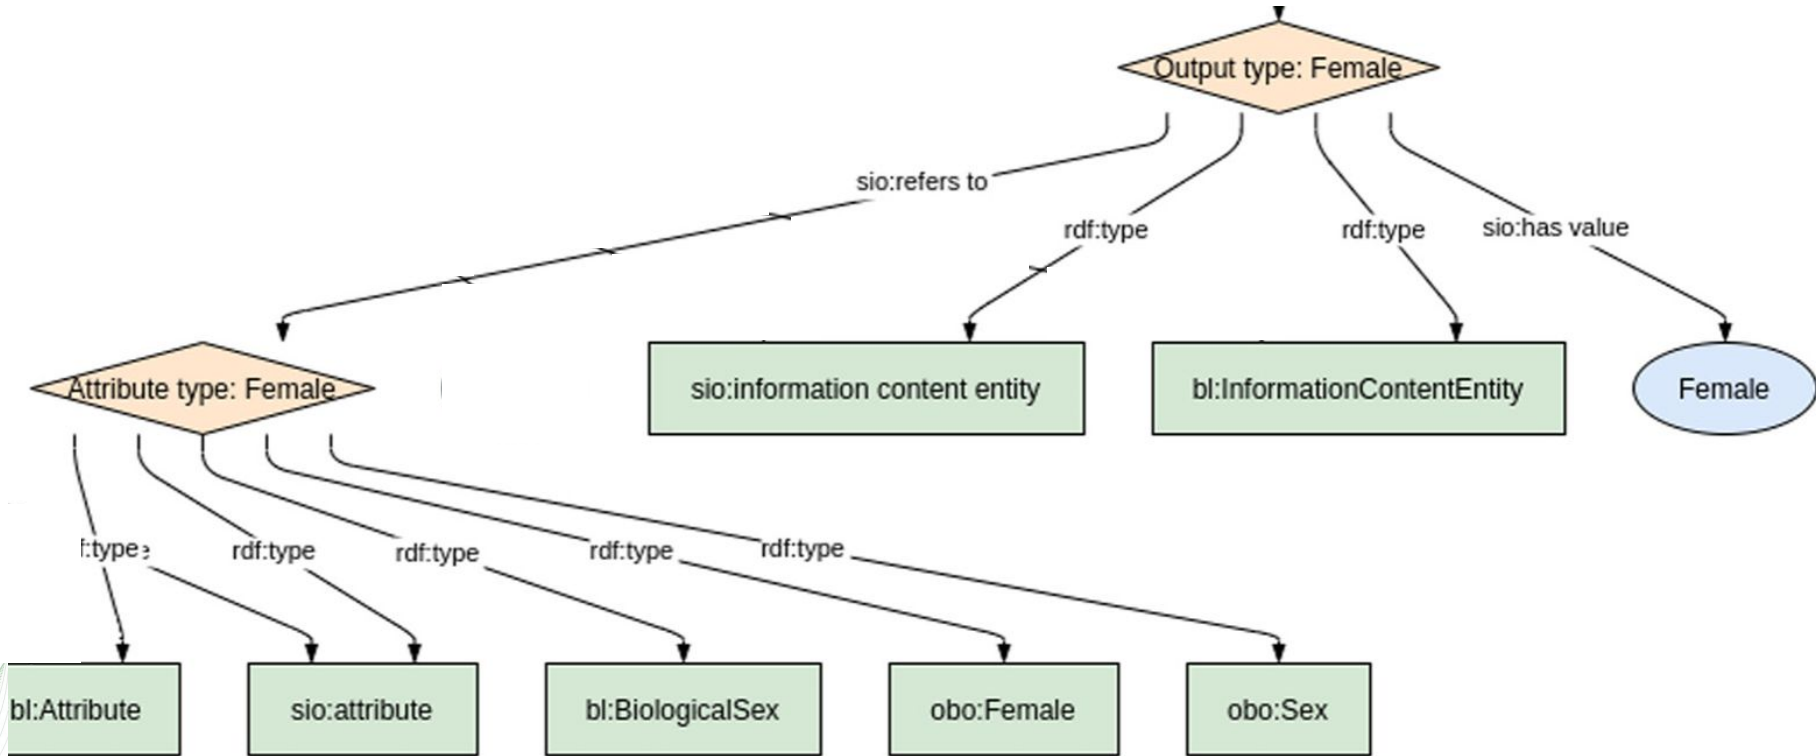

# Leveraging Biolink as a FAIR “Rosetta Stone” Between Clinical Semantic Models Provides Emergent Interoperability

Pablo Alarcón-Moreno\*, Ian Braunt†, Emily Hartley†, Daniel Olson†, Nirupama Benis‡,  
Ronald Cornet‡, Mark D. Wilkinson\* and Ramona L. Walls†

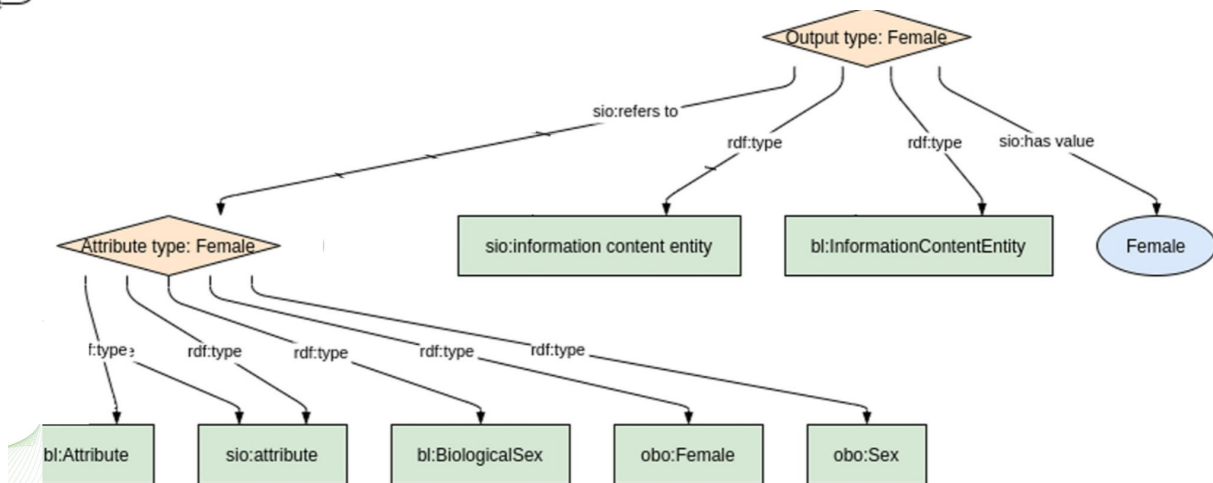

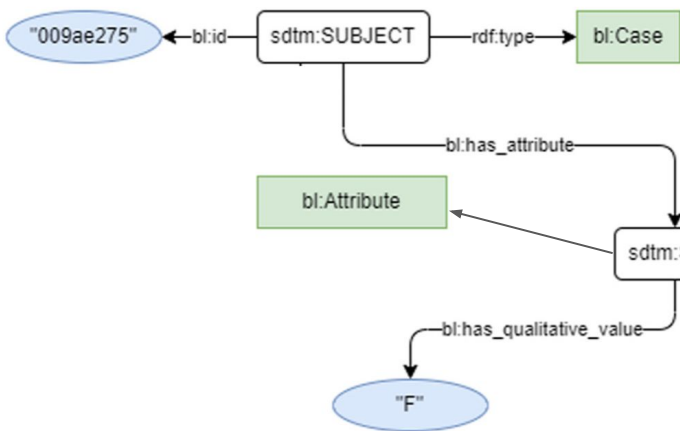

# The C-PATH Semantic Model for Biological Sex

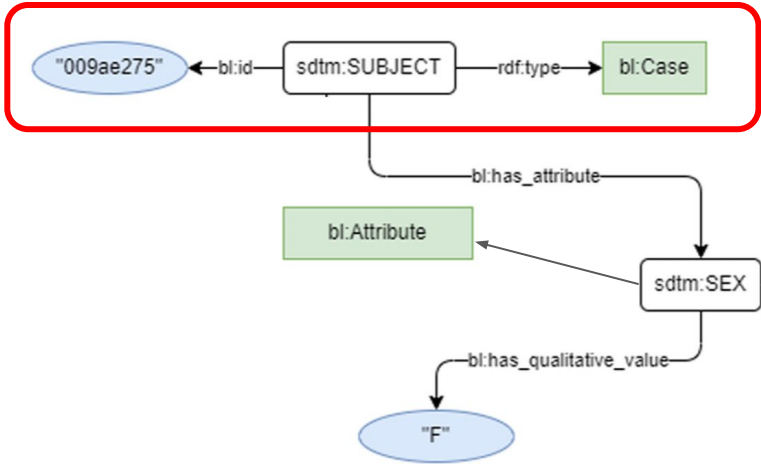

# The CARE-SM Semantic Model for Biological Sex

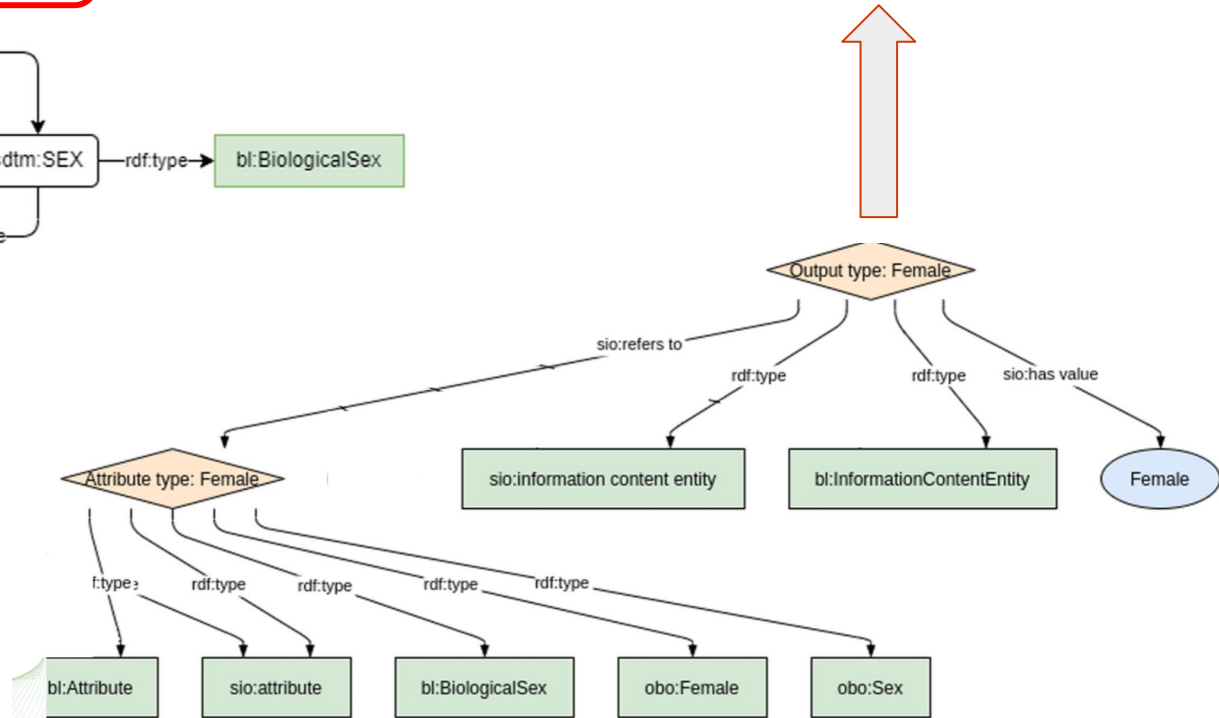

# Comparison of the “FAIR” Models

# Comparison of the “FAIR” Models

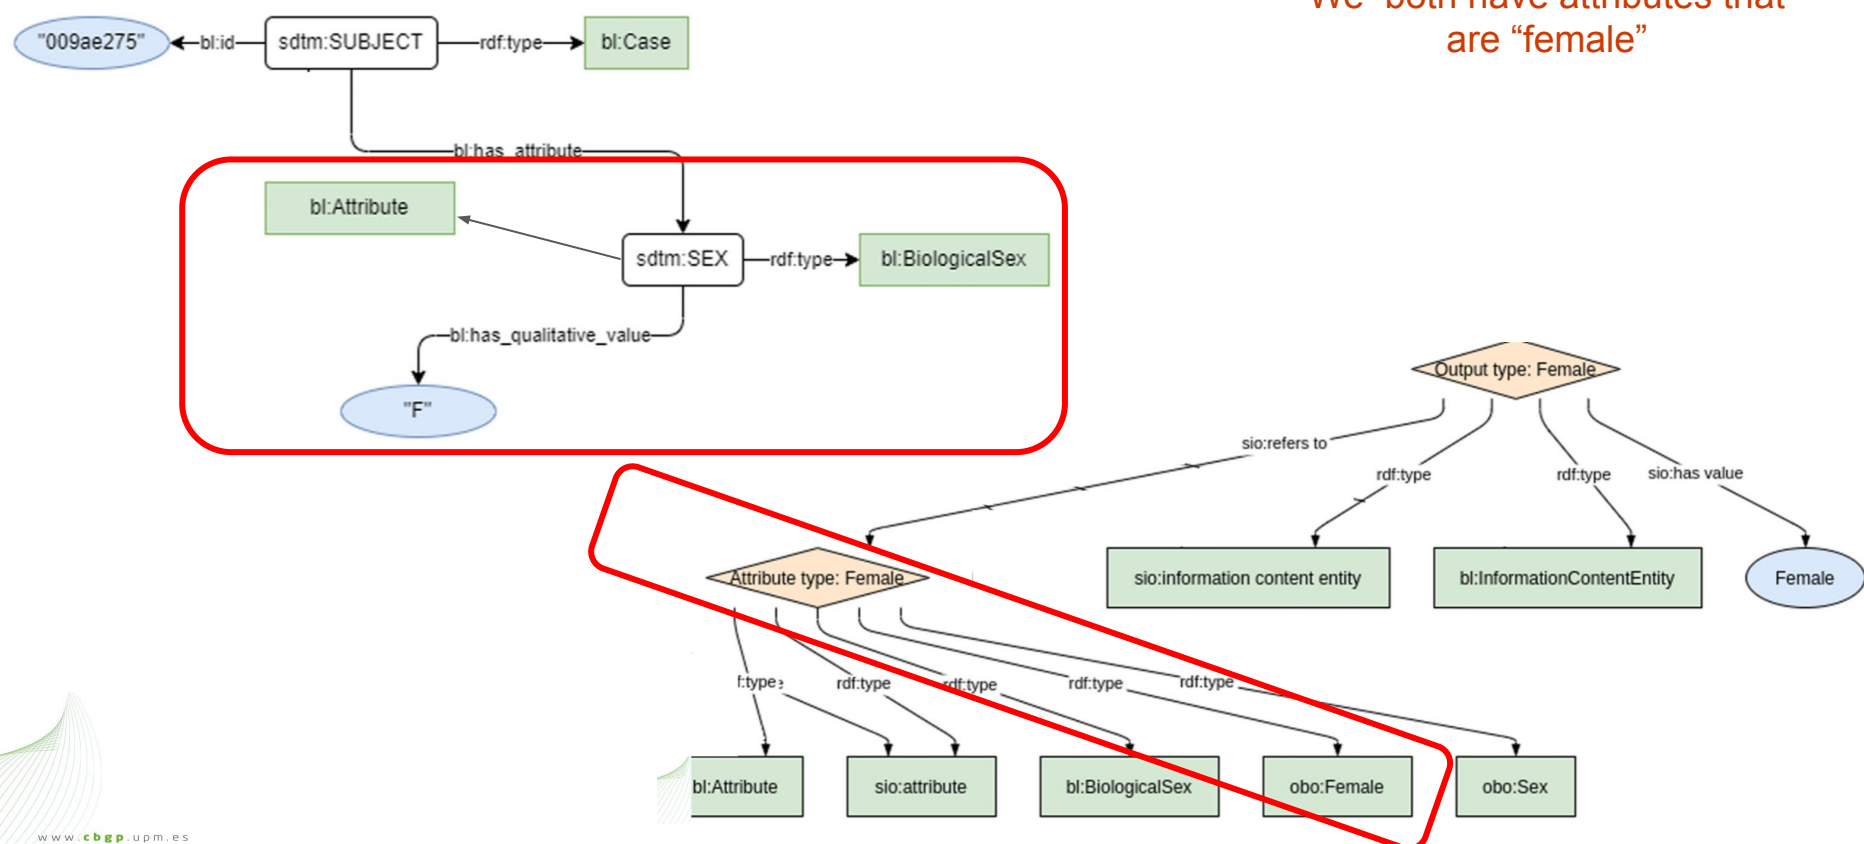

Our “patient” class is waaaay higher up in the model

# Comparison of the “FAIR” Models

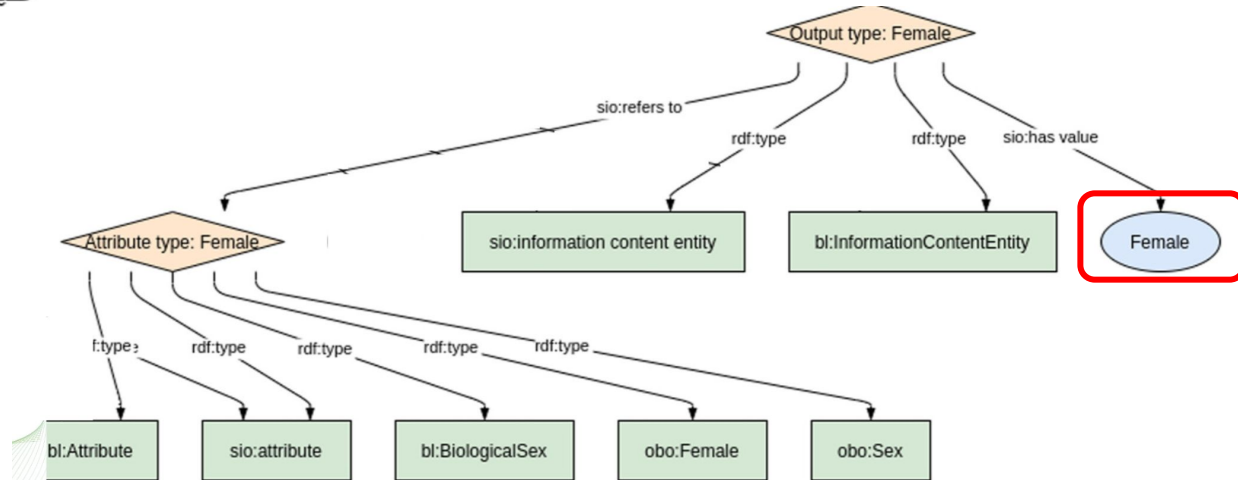

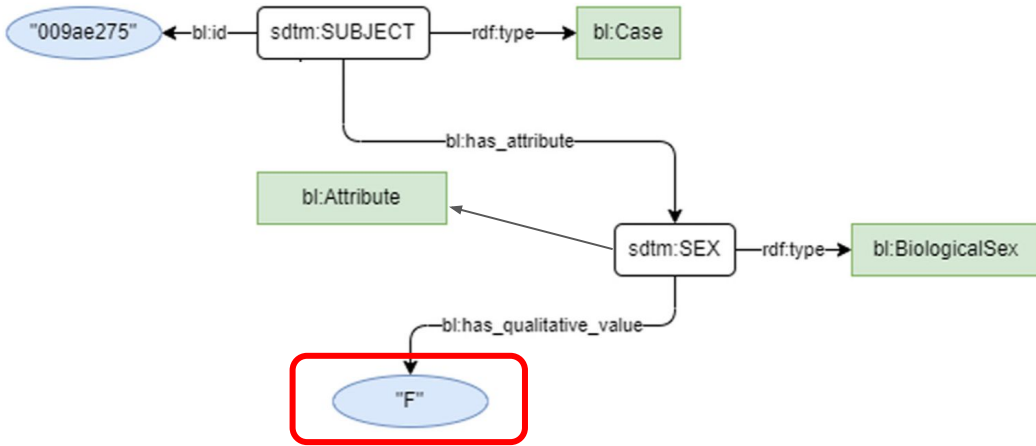

We both have attributes that are “female”

# Comparison of the “FAIR” Models

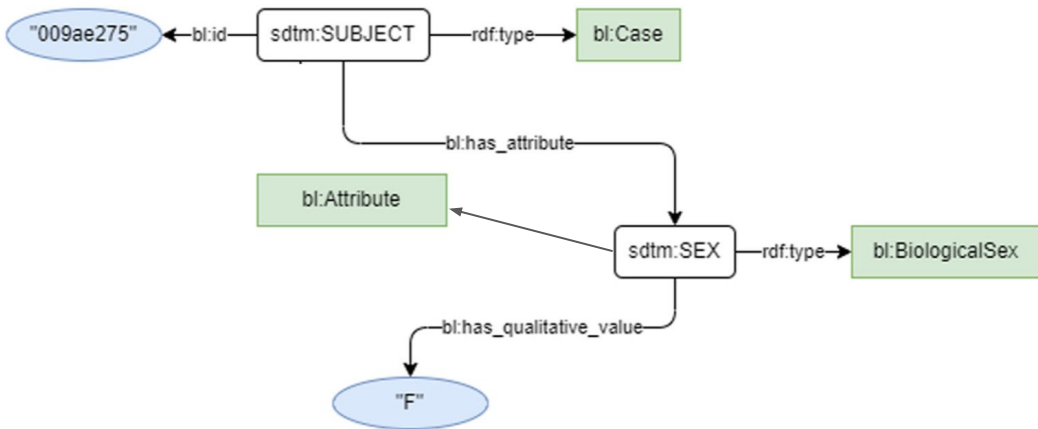

In their model, they use “F” where we use “Female”

...but...

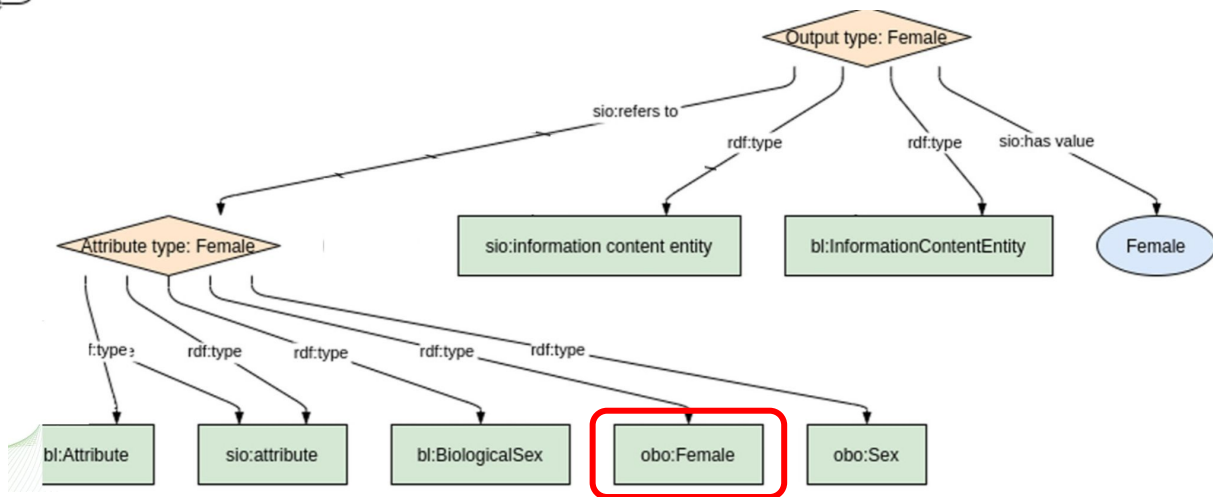

# Comparison of the “FAIR” Models

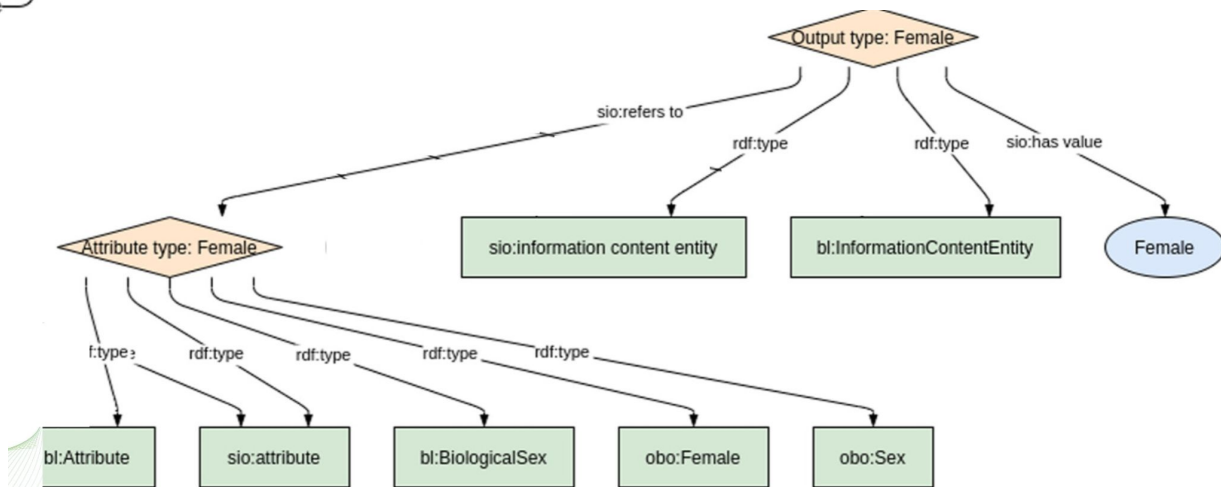

We don't put any utility in the string "Female" anyway

We use the NCIT Ontology term for "Female"

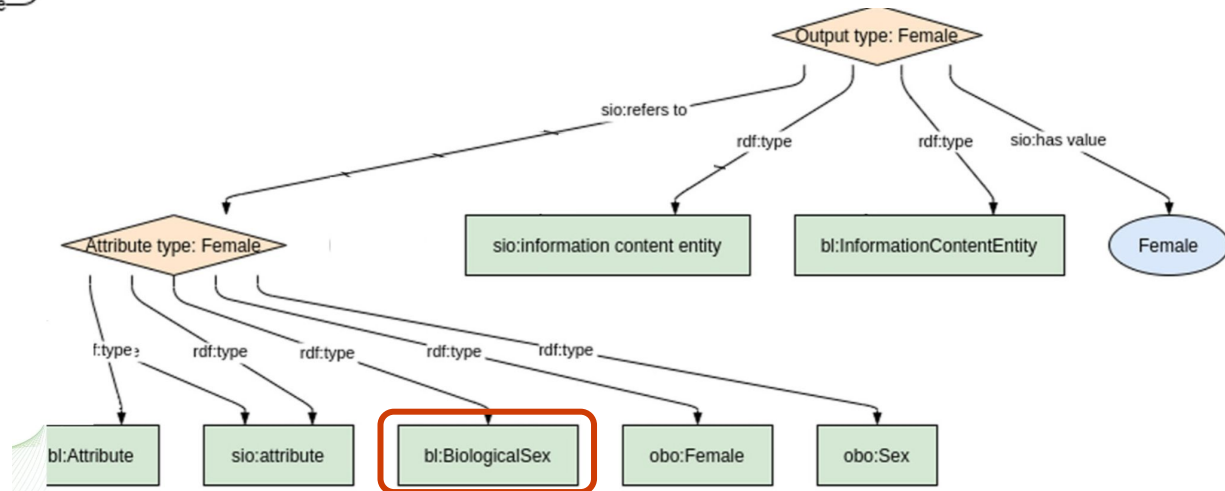

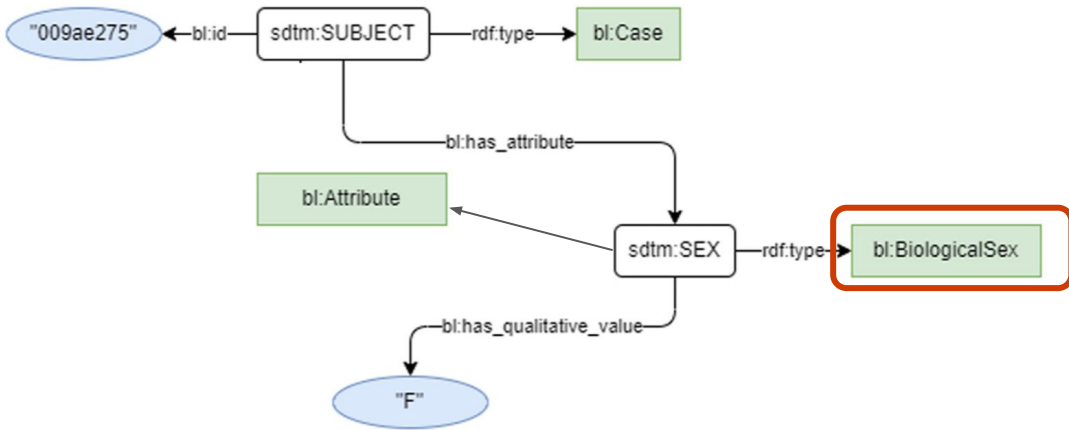

# Comparison of the “FAIR” Models

How do you approach integrating these two very different models?

# Comparison of the “FAIR” Models

In this experiment, both participants CHANGED our data, to “anchor” our shared concepts in a third-party biomedical vocabulary (BioLink)

# Did that work?

## Summary:

We were both making semantic models of the same data type(s)

We used different vocabularies, and different models, but both would be reasonably considered “FAIR”

We mutually set “anchor” points throughout our data such that an agent/query could find the “semantic intersection-points” between the graphs (i.e. we gave the agent a bit of an advantage)

# The Federated Query

## (this is a query for Leukocyte count, not sex)

?output a biolink:InformationContentEntity .
```

```
?output sio:SIO_000300 ?value .  
?output sio:SIO_000221 ?unitnode .  
?unitnode rdfs:label ?unit
```

# The Federated Query (relevant bits)

The remainder of  
the query was,  
nevertheless,  
distinct

```
?test a biolink:Procedure, ncit:NCIT_C51948 .  
?test ?has_output ?output .  
?output a biolink:InformationContentEntity .
```

```
?output bl:has_attribute ?att .  
?att bl:has_quantitative_value|bl:has_qualitative_value ?valnode .  
?valnode bl:has_numeric_value ?value
```

---

```
?test a biolink:Procedure, ncit:NCIT_C51948 .  
?test ?has_output ?output .  
?output a biolink:InformationContentEntity .
```

```
?output sio:SIO_000300 ?value .  
?output sio:SIO_000221 ?unitnode .  
?unitnode rdfs:label ?unit
```

# The Federated Query (relevant bits)

One team had the measurement modeled **as an attribute** of the output of the procedure

```

?test a biolink:Procedure, ncit:NCIT_C51948 .
?test ?has_output ?output .
?output a biolink:InformationContentEntity .
    
```

```

?output bl:has_attribute ?att .
?att bl:has_quantitative_value|bl:has_qualitative_value ?valnode .
?valnode bl:has_numeric_value ?value
    
```

The other team modeled the measurement **as the value** of the output

```

?test a biolink:Procedure, ncit:NCIT_C51948 .
?test ?has_output ?output .
?output a biolink:InformationContentEntity .
    
```

```

?output sio:SIO_000300 ?value . # SIO_000300 → “has value”
?output sio:SIO_000221 ?unitnode .
?unitnode rdfs:label ?unit
    
```

# The Federated Query (relevant bits)

And things like  
measurement units  
did not exist in one  
of the models

```
?test a biolink:Procedure, ncit:NCIT_C51948 .  
?test ?has_output ?output .  
?output a biolink:InformationContentEntity .
```

```
?output bl:has_attribute ?att .  
?att bl:has_quantitative_value|bl:has_qualitative_value ?valnode .  
?valnode bl:has_numeric_value ?value
```

---

```
?test a biolink:Procedure, ncit:NCIT_C51948 .  
?test ?has_output ?output .  
?output a biolink:InformationContentEntity .
```

```
?output sio:SIO_000300 ?value .  
?output sio:SIO_000221 ?unitnode .  
?unitnode rdfs:label ?unit
```

# We tried!

We tried many ways of solving the problem:

Pre-configured blocks of query fragments that could be dynamically assembled

Query clauses that were “OPTIONAL” between one model and another

Additional semantic anchors

(abortive) attempt to bring an ontological mapping service into the query as a third participant

# This paper compares two independent FAIRification efforts (C-PATH and CARE-SM) over identical data items

Journal of the Society for  
Clinical Data Management

Alarcón-Moreno P, et al. Leveraging Biolink as a FAIR “Rosetta Stone” Between Clinical Semantic Models Provides Emergent Interoperability. *Journal of the Society for Clinical Data Management*. 2022; 2(3): 2, pp. 1–8. DOI: <https://doi.org/10.47912/jscdm.130>

## ORIGINAL RESEARCH

# Leveraging Biolink as a FAIR “Rosetta Stone” Between Clinical Semantic Models Provides **Emergent** Interoperability

Pablo Alarcón-Moreno\*, Ian Braunt†, Emily Hartley†, Daniel Olson†, Nirupama Benis†, Ronald Cornet‡, Mark D. Wilkinson\* and Ramona L. Walls†

**Interoperability was almost zero!**

# This paper compares two independent FAIRification efforts (C-PATH and CARE-SM) over identical data items

Journal of the Society for  
Clinical Data Management

Alarcón-Moreno P, et al. Leveraging Biolink as a FAIR “Rosetta Stone” Between Clinical Semantic Models Provides Emergent Interoperability. *Journal of the Society for Clinical Data Management*. 2022; 2(3): 2, pp. 1–8. DOI: <https://doi.org/10.47912/jscdm.130>

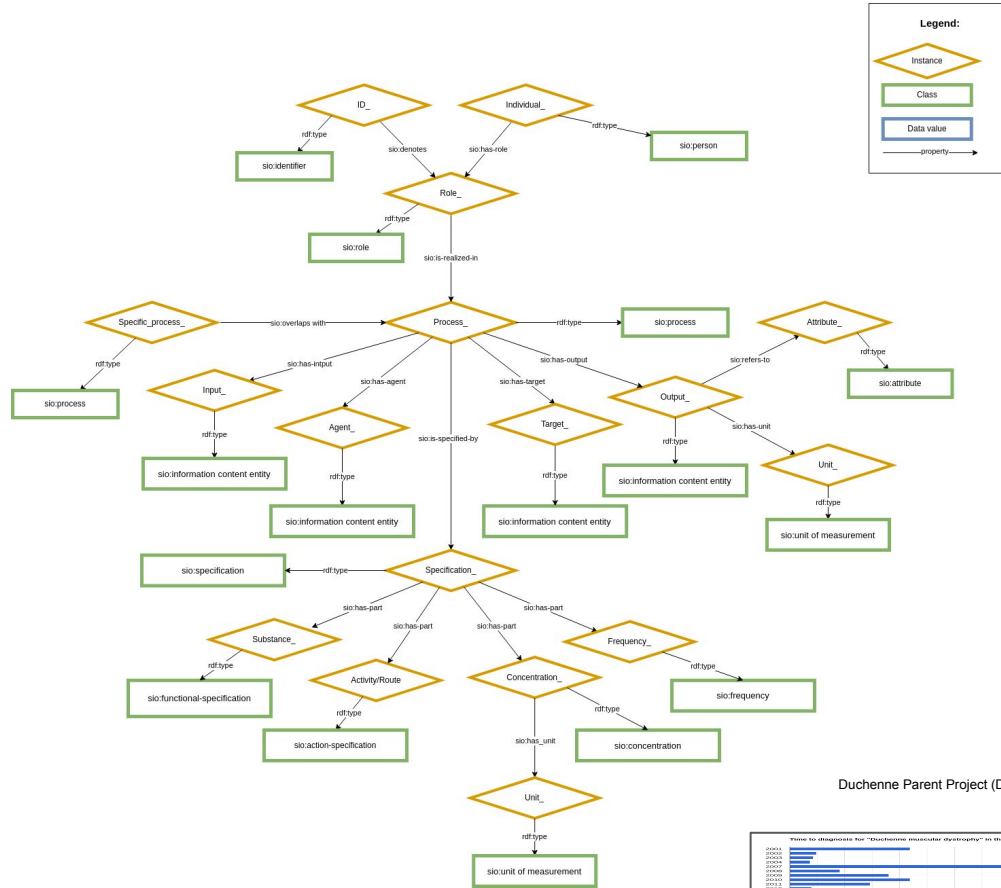

## ORIGINAL RESEARCH

# Leveraging Biolink as a FAIR “Rosetta Stone” Between Clinical Semantic Models Provides **Emergent** Interoperability

Pablo Alarcón-Moreno\*, Ian Braunt†, Emily Hartley†, Daniel Olson†, Nirupama Benis†, Ronald Cornet‡, Mark D. Wilkinson\* and Ramona L. Walls†

And this was even after ***we cheated*** by manually modifying the starting data by adding “anchors”!

# A shared data model is required for data-level reusability\*

Duchenne Parent Project (DPP)

EURO-NMD (mock data)

\* Note Principle R1.3

## Latest Initiative

Duplicate and expand the Rare Disease success story in the domain of **Seed (Germplasm) Banking**

**Santiago Moreno-Vázquez**

Universidad Politécnica de Madrid  
- Biodiversidad y conservación de recursos fitogenéticos  
- Professor BIOTECNOLOGÍA - BIOLOGÍA VEGETAL  
- Lead of the Banco de Germoplasma Vegetal de la UPM  
“César Gómez Campo”

# FLAIR-GG

## FAIRification, Linking And Integrated Reuse of Global *ex situ* plant Germplasm resources

*Dr. Santiago Moreno Vázquez*

*Dr. Mark D. Wilkinson*

*Oussama Mohammed Benhamed, PhD Candidate*

*Alberto Cámara Ballesteros, PhD Candidate*

One of the most complete collections of wild crucifers in the world (1,027 taxa with 4,863 accessions); Seeds of Iberian and Macaronesian endemic species; **currently preserves 24% of the threatened flora in Spain**

# FLAIR-GG Objectives

Replicate EJP-RDs success with  
BGV as our first target

...then expand!

## BGV FAIR Data Point

Metadata of the Banco de Germoplasma Vegetal de la UPM

Datasets Services

### Datasets

#### Administrative data from the BGV

Information about the institute and/or collection team responsible for the germplasm deposit

## Welcome to the EURO-NMD Hub Phenotype Frequency Analytics Notebook

The Phenotype Frequency Data Service will count the number of times a phenotype appears in a registry (on a per-patient basis - only counts once per patient)

Please run the first cell to set-up the analytics environment

In the second cell, we have pre-filled a basic analytics, to show you how to access and manipulate the data that was retrieved from the FLAIR-GG Virtual Platform.

Fill in the "key = 'XXXXXXX'" with the secret key for your federated exploration output, and then... go!

```
] : import pyodide_kernel
```

```
%pip install altair  
%pip install pandas  
%pip install requests
```

```
import altair as alt  
import pandas as pd  
import pyodide_http  
import ssl  
import json  
import requests  
import urllib3  
import urllib3.parse  
urllib3.disable_warnings(urllib3.exceptions.InsecureRequestWarning)  
print("DONE! Proceed to next cell and replace the XXXXX with your secret key")
```

### Pre-configured JupyterLite Notebook

```
] : import io  
import array  
import sys
```

```
key = "8c64411a-aeel-4ac9-bada-e51d70a3c9dd" # your secret key from the EURO-NMD Hub Virtual Platform
```

Copy/paste your key here

key = "8c64411a-aeel-4ac9-bada-e51d70a3c9dd" # your secret key from the EURO-NMD Hub Virtual Platform
```

```
[ ] : # Put
      # Your
      # Own
      # Code
      # Here!
```

Of course, your data scientists can do whatever analysis they wish using the data that is pre-extracted for them into the most popular analytics environment (Python Pandas)

# FLAIR-GG Next Steps

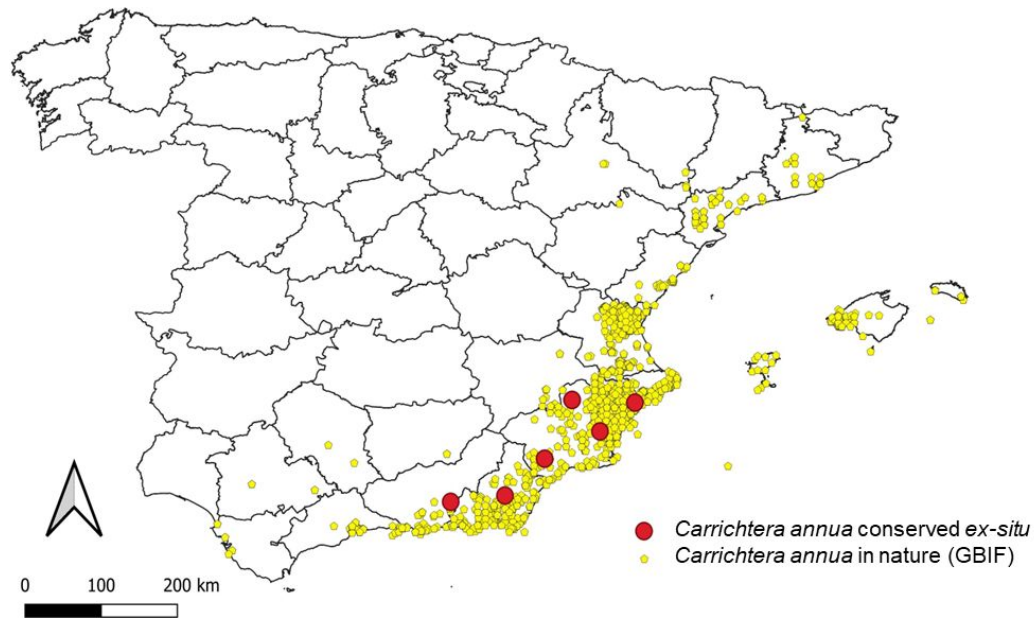

Begin constructing **shared queries** to help  
build data-driven conservation strategies

# FLAIR-GG Next Steps

Dynamic integration of partner seedbank collection records with **GBIF** species observations

## Conservation Strategy - Breadth:

*“What geographic locations have not been sampled by any collection expeditions from our network partners?”*

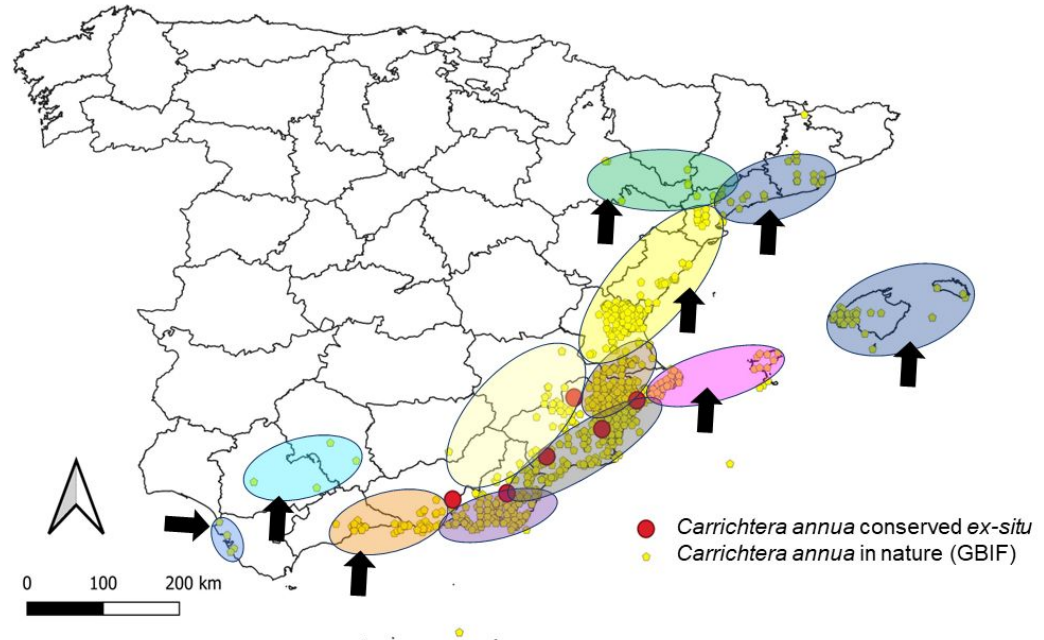

# FLAIR-GG Next Steps

Environment drives intra-species diversity - add resources such as AEMET (Spanish Meteorological Agency), IGME (Geological and Mining Institute), CNIG (Spanish Geographical Agency) to capture environmental information associated to territories where the species lives.

## Conservation Strategy - Depth:

*“Are there occurrence locations of species X that are within soil types or microclimates for which we lack samples in our germplasm banks?”*

# Which leads me to the final advance

Bringing third-party data (e.g. from the government) into the VP via a “Proxy”

# FLAIR-GG FDP Proxy

# Take Home Messages

Repeated examples of “interoperability” @ both metadata and data layers shows  
***FAIR is necessary, but not sufficient!***

FAIR is metadata first! Almost all useful behavior derived from rich metadata

FAIRness is measurable, but we need global governance of testing  
before anyone can trust FAIR quality assessment;  
**we are almost never able to measure the FAIRness of data**

Technologies/strategies allow FAIR experts to assist domain-expert data owners  
in creating FAIR (meta)data themselves

**Within a defined community**, a high degree of interoperability can be achieved  
through harmonization of semantics and models  
(which, of course, is unsurprising!)
